Everyday Probability

An original sample course for the teaching platform.

A probability measures how likely an event is.

Its value lies between 0 and 1.

Sample Spaces

A sample space lists all possible outcomes.

For one fair coin: S = {heads, tails}.

There are two equally likely outcomes.

Computing Probability

For equally likely outcomes:

P(event) = favorable outcomes / total outcomes.

A fair six-sided die has P(even) = 3 / 6 = 0.5.

Independent Events

One independent event does not change the next.

Two fair coin tosses have four equally likely pairs.

P(two heads) = 1 / 4 = 0.25.
